

pavo: Perceptual Analysis, Visualization and Organization of Color Data in R

Rafael Maia, Paul-Pierre Bitton, Chad Eliason

November 27, 2012

Introduction

Although **pavo** deals largely with spectral reflectance data from bird feathers, it is meant to be applicable for a range of taxa. It provides flexible ways to input spectral data from a variety of equipment manufacturers, process these data and...

pavo was written with the following workflow in mind:

1. **Organize** spectral data by inputting files, processing spectra (e.g., to remove noise, negative values, smooth curves, etc.)
2. **Analyze** the resulting files, either using typical tristimulus color variables (hue, saturation, brightness) or using visual models based on perceptual data from the taxon of interest.
3. **Visualize** the output

1 Organizing and Processing Spectral Data

blah blah blah

2 Analyzing Spectral Data

2.1 Overview

add description here

2.2 Variables calculated

Color		
Variable	Equation	Description
B1	$\sum_{\lambda=300}^{700} R_{\lambda}$	Total brightness, total reflectance
B2	B_1/n_{wl}	Mean brightness.
B3	R_{\max}	Intensity.
S1		Chroma, spectral purity.
S2	R_{\max}/R_{\min}	Spectral saturation
S3		
S4		
S5		
S6		
S7		
S8		
S9		
S10		
H1	$\lambda_{R\max}$	Hue: wavelength of peak reflectance
H2		
H3		
H4		
H5		

Table 1: The complete set of tristimulus variables calculated by `summary` in `pavo`

Color variables described in Table 1.

blah blah blah¹ and also this.

3 Visualizing Spectral Data

Examples

```
> hist(rnorm(50))
```
